

**Directions:**

Test your aquarium's phosphate level prior to use. It is recommended to maintain phosphate level below 0.03 ppm (mg/L). Six drops of Phosphate Control will lower your phosphate by 1 ppm (mg/L) for every 10 gallons (37.9 liters) of water. Do not lower your phosphates more than 1 ppm in a 24-hour period. For best results, add in high flow areas one drop at a time. Some temporary cloudiness may occur when adding this product. Cloudiness will clear up within 24-hours. For accurate results, wait 24-hours before re-testing your phosphate level. Wait ten minutes before dosing other supplements. Test regularly and treat as necessary.
