

Dosage:

Read all the above text before commencing with the treatment!

- 1 drop for every 4 liters or 1 gallon
The dropper contains approx. 300 drops (10ml). The dropper cap holds approx. 90 drops. So 1 cap full is good for 360 liters or 90 gallons.

Add it in a high flow area of the tank. If you want to treat a refugium only and if it's volume is too small for using a powerhead then mixing should be done manually.

- It should start to work within 30 minutes.
- If within 45 minutes no visible death of flatworms occurs add 50% more.
- As soon as the flatworms start to die, commence with the activated carbon to take out any toxic body juices. Also see the above given important remarks.
- After an hour or so you can turn any UV or ozone on again.
