

**Directions:**

Use 250 ml (8.45 fl. Oz.) for up to approximately 125-250 gallons. This will last up to 3 months.

Above mentioned recommendation is for tanks with an average input of food and a low initial phosphate concentration. Regular testing with a good quality phosphate test kit will tell you when the Phosphate-Killer has to be renewed.

**Important:**

This product has a typical grain size of 0.2-2mm. Transportation might have caused some very fine dust. The best way to use this product is in a canister filter with a slow but forced flow. Use at least 3 inches of floss on each side (packed lightly). Discard the first 0.5 gallon of water or more until all the dust has disappeared. It can also be used in a filter sock. Use the appropriate mesh size. Wash this product when packed in the sock but do NOT knead it. Never use it in a fluidized filter since this might create a lot of fine dust.
